

JUDITH A. JAKUBOWSKI

Senior Program Manager | Enterprise Platforms & Governance

Charlotte, NC • [linkedin.com/in/judith-a-jakubowski](https://www.linkedin.com/in/judith-a-jakubowski)

PROGRAM MANAGEMENT

Work Samples Portfolio

Four initiatives demonstrating governance design, platform modernization, measurable business outcomes, and AI-augmented program management practice.

INCLUDED IN THIS PORTFOLIO

1. Enterprise Product Catalog Modernization
2. Change Management Migration & Governance Redesign
3. Cloud Contact Center Configuration Rules Engine
4. Self-Directed AI Fluency & Applied Program Management

Enterprise Product Catalog Modernization

Fortune 50 Telecommunications Company | Senior Program Manager | Enterprise Platforms & Governance

BUSINESS CHALLENGE

An enterprise product catalog supporting 250+ active offerings and a multi-billion-dollar annual revenue portfolio had outgrown its user experience. Reporting was slow, search results lagged, and workflows required excessive navigation. Internal adoption sat near 5%, with most users routing requests through a small group of platform specialists rather than working in the system directly. As the platform scaled, the gap between business demand and delivery throughput widened, and enhancements were difficult to release without disrupting revenue-critical operations.

ACTION

- Led Agile delivery across cross-functional, multi-region teams, governing a backlog of 200+ user stories and defects per cycle and aligning product, engineering, BA/Dev/QA, finance, legal, and operations stakeholders around measurable outcomes.
- Redesigned core workflows and navigation in partnership with users, embedding performance improvements (reporting, global search, data downloads) directly into the platform rather than treating them as secondary enhancements.
- Introduced iterative planning, Jira-based workflows, and frequent demos to accelerate feedback loops and keep stakeholders engaged across releases.
- Coached delivery teams on Agile practices in real time, strengthening backlog quality, acceptance criteria, and sprint discipline so improvements were sustained beyond the initial rollout.
- Engaged operational users early through structured demos, working sessions, and feedback channels so enhancements reflected real workflows instead of assumed ones.

RESULTS

- Internal adoption rose from approximately 5% to 70% as stakeholders began working directly in the platform rather than routing requests through specialists.
- Delivery throughput increased by 70%, enabling faster, more predictable releases across a multi-billion-dollar revenue portfolio.
- Reporting time dropped to under 60 seconds, global search to under 2 seconds, and data downloads to under 10 seconds.
- Required clicks for core workflows were reduced from 17 to 4, materially simplifying the user experience.

- Achieved 100% adoption of the new functionality across the supported user base.

TRANSFERABLE LEADERSHIP SKILLS

Enterprise platform modernization • Agile delivery at scale • Cross-functional stakeholder alignment • User-centered design and adoption

Change Management Migration & Governance Redesign

Fortune 50 Telecommunications Company | Senior Program Manager | Enterprise Platforms & Governance

BUSINESS CHALLENGE

Enterprise change requests were being managed through a fragmented SharePoint-based process that no longer worked as the portfolio grew. With 1,500+ active change requests and 400+ new initiatives flowing through the portfolio annually, leadership lacked real-time visibility into status, dependencies, and governance posture. Manual tracking created audit risk, approval delays, and inconsistent reporting across more than ten functional groups. Implementation cycles for a high-volume platform stretched to roughly 90 days, slowing the organization's ability to respond to commercial demand.

ACTION

- Partnered across product, engineering, finance, legal, regulatory, and operations stakeholders to redesign the intake and governance process before migrating, ensuring the new system reflected how work actually flowed rather than codifying broken practices.
- Led migration of 1,500+ change requests into structured PEGA workflows, with automated approval routing, escalation controls, and standardized compliance reporting built into the platform.
- Defined workflows, approval paths, and reporting requirements that delivered real-time stakeholder visibility while preserving the iterative pace of Agile delivery teams.
- Coordinated execution of a high-volume backlog in parallel with the migration, facilitating planning sessions, dependency mapping, and recurring governance forums across 10+ functional groups.
- Introduced clearer dashboards, streamlined approvals, and consistent operating rhythms so the new governance model was usable in daily delivery, not just compliant on paper.

RESULTS

- Replaced manual SharePoint tracking with a scalable, auditable PEGA platform giving teams real-time visibility into status and dependencies across 1,500+ active and 400+ new annual change requests.
- Reduced implementation timelines from 90 days to 30 days, a 67% reduction, on a high-volume enterprise platform.
- Established a repeatable governance framework balancing compliance with agility, supported by automated dependency validation controls that reduced configuration errors and downstream rework.

- Improved audit visibility and risk tracking across tens of thousands of annual transactions serving a global enterprise customer base.
- Delivered leadership-grade reporting that shifted governance conversations from reactive escalation to data-informed decision-making.

TRANSFERABLE LEADERSHIP SKILLS

Process automation and platform migration • Governance design at enterprise scale • Audit and compliance readiness • Multi-stakeholder program coordination

Cloud Contact Center Configuration Rules Engine

Fortune 50 Telecommunications Company | Senior Program Manager | Virtual Contact Center

BUSINESS CHALLENGE

A Virtual Contact Center offering had grown into a complex portfolio of 500+ configurable features. As the catalog expanded, order entry teams could no longer reliably determine which features could be combined, relying on manual checks and institutional knowledge to validate configurations. The result was frequent order errors, rework, and customer-facing delays. New feature launches were further constrained because each change to compatibility logic required an IT release, slowing the platform's ability to respond to evolving customer demand.

ACTION

- Led the Agile delivery approach across product, engineering, BA/Dev/QA, operations, and order entry stakeholders, translating complex feature relationships into configurable, rules-driven workflows.
- Designed flexible rule sets rather than hard-coded logic, so the system could evolve as the product portfolio expanded without requiring IT releases for every business change.
- Built governance and audit controls directly into the rules management capability, enabling business users to manage configuration updates while maintaining traceability, approval routing, and audit readiness.
- Prioritized the backlog, mapped cross-team dependencies, and iterated through sprints using Jira dashboards, with frequent demos to keep stakeholders engaged through release.
- Brought operational users into early design workshops so the rules engine anticipated feature growth from day one rather than being retrofitted under pressure.

RESULTS

- Reduced clicks required to configure a valid order from 10+ to 1, materially simplifying the order entry experience for sales and operations users.
- Improved order processing time by 25%, with corresponding reductions in configuration errors and rework.
- Enabled the business to implement compatibility rule changes in under 30 days, removing the IT release dependency that had previously gated new feature launches.
- Delivered a scalable, configurable foundation that supported continued growth of the Virtual Contact Center platform without proportional growth in operational overhead.

TRANSFERABLE LEADERSHIP SKILLS

*Product configuration and rules-driven platforms • Business-managed governance design •
Cross-functional Agile delivery • Scalable, AI-ready solution architecture*

Self-Directed AI Fluency & Applied Program Management

Independent Practice | Senior Program Manager | AI-Augmented Delivery

BUSINESS CHALLENGE

Generative AI moved from emerging technology to enterprise expectation in under two years, reshaping how program managers are expected to draft, analyze, govern, and deliver. PMs without working fluency in AI tools risk being measured against a new productivity baseline they were never trained for. Over the past several months, I made a deliberate decision to build practical AI fluency as a genuine work multiplier — not as a credential to claim, but as a working capability applied daily across program management, professional development, and complex problem-solving. The goal was substance, not surface familiarity: enough fluency to use AI as a real force multiplier while maintaining the human judgment, governance discipline, and accountability that program management requires.

ACTION

- Established a daily AI working practice across multiple platforms, treating each tool as a distinct capability rather than interchangeable products, and developing pattern recognition for which tool fits which task.
- Built custom PMP study guides and interactive practice tests using AI to support exam preparation, working through structured content generation, scenario practice, and targeted review across all five PMBOK domains.
- Created paralegal study guides supporting UNC Charlotte certificate coursework, using AI to work through real legal concepts and procedures including civil procedure, legal ethics, wills and estates, and legal writing.
- Ran program management practice scenarios to keep delivery, governance, and decision-making skills sharp during career transition, treating AI-generated scenarios as structured rehearsal rather than passive content consumption.
- Applied AI to complex, real-world problem-solving including multi-stop trip planning that integrated historic site routing with specific logistical constraints, demonstrating that AI fluency extends well beyond document drafting into analysis, research, and decision support.
- Self-taught complementary technical skills in parallel, including Power BI (DAX formulas, Power Query, visual design), to deepen the analytical foundation that makes AI outputs interpretable rather than accepted on faith.
- Developed a personal governance framework for AI use: confidentiality boundaries, source attribution discipline, hallucination checks, and the principle that AI output, no matter how polished, must always be verified — directly transferable to organizational AI governance work.

RESULTS

- Passed the PMP exam with above-target scores across every domain, using AI-supported study guides and practice tests as a core part of preparation alongside structured coursework.
- Achieved daily working fluency across multiple AI platforms, with demonstrable application to professional development, program management deliverables, governance documentation, and complex analysis.
- Built a self-directed learning model spanning AI tools, Power BI, paralegal coursework, and PMP certification — demonstrating the disciplined upskilling capacity that distinguishes senior program managers in rapidly evolving enterprise environments.
- Developed a working point of view on AI governance grounded in actual use rather than theoretical familiarity, applicable to organizational AI policy, vendor evaluation, and risk management conversations.
- Translated personal AI fluency into a portfolio of public-facing professional artifacts including written portfolios, tailored application materials, and a LinkedIn presence built on consistent, AI-augmented output discipline.

TRANSFERABLE LEADERSHIP SKILLS

Self-directed upskilling and continuous learning • AI-augmented program management practice • Governance thinking applied to emerging technology • Trust the process, but verify the output — every time
